

Demonstration of Proposed Functionalities

Smart Lender | Team Lead: Thoka murali

Functionalities to Be Demonstrated

- 1. Loan application input form - collecting applicant details (income, credit history, loan amount, etc.).
- 2. Real-time prediction - submitting the form triggers the trained ML model to classify the application.
- 3. Result display - Approved/Rejected outcome shown clearly to the user.
- 4. Underlying model comparison - brief walkthrough of how Decision Tree, Random Forest, KNN, and XGBoost were compared.

Demo Flow

- Step 1: Open the Smart Lender web app in a browser.
- Step 2: Enter a sample applicant's details into the form.
- Step 3: Submit the form and show the instant prediction result.
- Step 4: Repeat with a second, contrasting applicant profile to show different outcomes.
- Step 5: Briefly show the codebase structure (Epics 1-5) and explain the pipeline.

Expected Outcome

The audience should clearly see that the application takes raw applicant input and returns a fast, consistent eligibility prediction, fulfilling the core problem statement defined in the Brainstorming phase.
