

Brainstorming & Idea Prioritization

Smart Lender | Team Lead: Thoka murali

Objective

To explore possible problem areas in the lending/banking domain and prioritize the most impactful and feasible idea for the Smart Lender project.

Ideas Considered

Idea	Feasibility	Impact	Selected
Automated Loan Eligibility Prediction	High	High	Yes
Credit Card Fraud Detection	Medium	High	No
Loan Amount Recommendation System	Medium	Medium	No (future scope)
Chatbot for Loan Queries	Medium	Low	No

Why Smart Lender Was Selected

- Directly solves a real, recurring problem faced by both banks and applicants.
- Dataset for loan eligibility prediction is readily available and well-structured.
- Achievable within the project timeline using standard classification ML algorithms.
- Clear, measurable success criteria (accuracy, precision, recall of predictions).
- Scope can be extended later (loan amount prediction, fraud checks) without redesigning the core system.

Prioritization Method

Ideas were scored on a simple Impact vs Effort matrix. Automated Loan Eligibility Prediction scored highest on impact while requiring moderate effort, making it the clear choice for the MVP.
