

Define Problem Statements

Smart Lender | Team Lead: Thoka murali

Problem Statement

Financial institutions receive a high volume of loan applications daily. Manually verifying applicant income, credit history, and other factors is slow, inconsistent, and prone to human bias, leading to delayed decisions and occasional unfair rejections or approvals.

Who Is Affected

- Loan applicants who face long waiting times and unclear rejection reasons.
- Bank/NBFC loan officers who must manually cross-check large volumes of data.
- Financial institutions that bear the operational cost of manual review and the risk of inconsistent decisioning.

Problem Statement (Refined)

"How might we help financial institutions predict loan eligibility quickly and consistently using applicant data, so that approval decisions are faster, fairer, and data-driven?"

Goals

- Reduce average loan decision time from days to seconds.
- Provide a consistent, bias-reduced prediction based on historical data patterns.
- Give applicants instant feedback on their estimated eligibility.

Non-Goals (Out of Scope for MVP)

- Replacing human underwriters entirely.
- Real-time integration with live banking/core-banking systems.
- Legal/regulatory compliance certification (academic project only).
